**Mathematics for a Monaco led European World Order:
Random Monte Carlo Luck Against God is an American Loser**

Keith N. Gustafsson, M.Sc., Dr. (h.c.)

February 21, A.D. 76

OXFORD GLOBAL ESSAY COMPETITION

Only a few men at the top of science, physics and mathematics knew the aggregated truth about the enormous nuclear weapons technology programs at the end of World War II. Most of them became famous, such as the theoretical physicist J. Robert Oppenheimer and Albert Einstein. L. Ron Hubbard studied the first class on nuclear physics in U.S.A. before World War II. He knew everyone at the top of the nuclear bombs development programs. L. Ron Hubbard was offered well-paid jobs to develop atom-bombs in U.S.A. and Russia, but he refused such jobs. Instead, he published the New York Times bestseller "Dianetics the Modern Science on Mental Health" in Christian year 1950, which became year A.D. 0 in Scientology for a new religious epoque. L. Ron Hubbard disagreed with his classmates and he disagreed with his friends at Los Alamos and at the Manhattan nuclear weapons development project. Scientology was in the opinion of L. Ron Hubbard the truth and the solution to future survival on Earth. He wrote that there is no alternative to Scientology. Hubbard did not define psychiatry as his enemy, but he claims that psychiatry attacked him and Scientology, so that Scientology had to defend itself and fight back with ethics and human rights. Later on, psychiatry Professor Emeritus Thomas Szasz together with Church of Scientology support established the Citizens Commission on Human Rights after it was discovered that there is an alliance between all governments and psychiatry. Scientology found itself as an opposition to governments, which led L. Ron Hubbard into establishing the Sea Organization in Christian year 1967 (A.D. 17) on ships to break away from suppressive governments in the name of self-determinism and total freedom. L. Ron Hubbard used Scientology to inform about the truth as it was according to him, and the truth will surprise you, because according to Scientology, mathematics is no absolute truth. Mathematics is a government led psychiatry scam to

eventually fool you into meaningless nonsense. Math only has relative truth, i.e. sometimes it is more right than wrong but it has no absolute truth. Only religion has.

According to L. Ron Hubbard, any confusion is stupidity. No mathematics can correctly predict the stock market. A good financial analyst is right on his bets more than 50% of the time, i.e. financial mathematics is a game. A deadly game that can lead to no pension, wars, empty bank accounts and no food on the table. Hubbard wrote: "few have saving to survive a few days" and then he wrote that: "people hope good luck will take them alive through next storm." He also wrote: "those who depend on luck rarely make it," and 55 million persons died in World War II. Randomity almost never solves a problem. According to L. Ron Hubbard Confusion is random movements. Confusion leads to stupidity. 99% of all education fails into stupidity because the student was confused. Confusion is uncertainty, which is an idiot according to Scientology, and real intelligence is to be able to handle confusion. Hubbard claims that in order to confuse someone, all that is required is to identify their stable datum and shake it to invalidate it. Mathematics is today a stable datum that everyone believes in to have a job. Invalidate mathematics and everyone becomes an unemployed idiot living in confusion to depend on good luck that never happens, i.e. people will die if USA mathematics is a scam.

L. Ron Hubbard writes that James Clark Maxwell in London 1865 was the last real math. The square root out of minus one is not an imaginary unit, because it does not exist. Can you imagine "i"? No. It is nonsense. According to L. Ron Hubbard, the fourth dimension is mathematical gibberish and does not exist. Oxford defines gibberish as: "words that have no meaning or are impossible to understand." Basic ideas, such as " $2-1=1$ " does not hold up for scrutiny. L. Ron Hubbard claims that: " $2-1=2$ ". If you have two apples on a table and you remove an apple from the table, then you still got two apples which proves that " $2-1=2$." A Muslim professor said: " $1+1=1$ " and showed two sand dunes. By adding them together makes one larger sand dune, i.e. " $1+1=1$ ". Push the argument to the limit, and you believe in controversial "string theory" and "the theory of everything" until you go insane. Quantum computers may function, but a Schrödinger's cat can never in God's eyes be dead and alive at the same time. String theory is described as "beautiful mathematics" but could be wrong in the physical universe. Many physicists today claim that string theory is wrong and dismiss it as mathematical gibberish. When you push professors in physics and mathematics on the real truth of their own existence, many of them end up questioning the existence of a soul and eventually they conclude that God can not be sensed or measured and therefore God does not exist. This disqualifies the majority of the top physicians and mathematicians as dialectic materialism communists. If the soul and God does not exist, because it cannot be found anywhere in the physical universe, how come then that imaginary units and a fourth dimension could exist? People claim the highest speed is the speed of light, but is that true? Quantum physics has for decades made instant communication faster than light. There is no communication lag. The girl has a "sixth sense" and then claims: "you do not like me" and it is true, so what can you do about that with mathematics? Nothing. Most real world phenomena are too complex to be described with mathematics. People talk about telepathy

and UFOs, and then mathematics fail to explain it. Ask ChatGPT what the applications are for string theory and the theory of everything, and there are none. Albert Einstein discovered that time is the fourth dimension, which creates the famous space-time. However, L. Ron Hubbard claims there is no fourth dimension. Is gravity the bending of space-time? If you manage to conceptualize this in your mind, then you are at best insane. The university professor told his students to buy this and that socialist book on mathematics, but what did the students really get? Ideological socialism and no mathematics. Risk has become popularized as the new mathematics where nothing is certain, i.e. everything is a random event where chance meetings and gambling rules the world. The American continent is built upon the idea of risk and potential profits, i.e. no pain leads to no gain and no risk means no investment returns, so you got to take risks to have rewards. Europe was always more experienced and used to shy away from risk. The point is that Europe was right with God, and USA is wrong with hazard games that violate the Bible. Does random events exist, or is everything pre-determined in life? L. Ron Hubbard bluntly states that control is senior to risk. Flip a coin, and you say it is 50% probability for this or that side to land up. Is that true? That is the same thing as saying: "drive a car and it is 50% chance you turn left and 50% risk you turn right." Of course to drive a car is not like that. There is no such risk. The driver controls the car. You can control a car, so if you think "turn right," then the car turns right and that is Dianetics where the mind controls the body. There is good control and bad control, but any control skill is a gradient scale. The point is that it is a competence to control something and anything can be controlled. Even flipping a coin. A perfect magician would be able to always get face up when flipping a coin. Take a high-precision robot and you can program the hand of that robot to flip a coin with a guaranteed control so that a certain side of the coin will land up. Any movement can be controlled. Life is just a billiard ball game where atoms move in pre-determined directions under the control of God. Any movement is either well controlled, or bad controlled, which means that the concept of risk, probabilities and randomness is bad control. Books are burning in East Berlin. People wake up to the fact that life and existence is not a risk and that life is not mathematics. USA refuses to give up, and is willing to take risks against God, but the American God is Scientology control. The gambler who depends on good luck for success becomes a loser. If you use drugs you get into bad control and randomness is true to you. Just remember that the one who depends on luck will fail. Why does Europe have such rigid class-societies? All is a pre-determined life. Homo sapiens can not change its own destiny. You may call it God, and it is better so than to believe in anything else. Put your hand on the table. Lift the hand from the table. Did the hand move? Yes. Why did the hand move? Was it a random event? Was it your own self-determinism to move the hand? Did this text instruct you to move the hand? Or none of that, and was it all pre-determined sub-atomic movements that could be very well predicted? If all is a pre-determined movement of the hand, then the argument leads into dialectic materialism and communism. If you believe in any form of self-determinism and self-control, then you have a soul and God does exist. However, only Scientology gives you real self-control through self-control to change and improve otherwise pre-determined conditions of your own existence. Have you lived before? Mathematics will never answer that question.

What happens after death? Mathematics has no answer. Physics tells you that after death you end up as a few atoms and molecules worth nothing. Is that right? No. The soul leaves a dead body. Why is Sweden in NATO? Random event, or pre-determined after World War II or long before that? Any good analyst would say it was obvious in year 1517 during the Protestant reformation that Sweden will join NATO due to how Protestants disconnected Vatican neutrality from Sweden. Even if USA's randomness did exist, it can be controlled. Flip a coin and lose the stake 1:- to the other gambler. Double the stakes and flip the coin again. You lost 2:-, i.e. 3:- in total. Double the stakes and flip a coin again. You lose 4:-, and 7:- in total. Double the stakes from 4:- up to 8:- and flip the coin again. You lose 8:-, and $8+7=15$:- in total. Double the stakes up to 16:- and flip the coin. Sooner or later you will win. You now win the bet 16:- from the other gambler to have 32:- after a total of 15:- accumulated losses, i.e. the other gambler won 15:- from you but ends up losing 1:- as the other gambler must add 1:- to the 15:- won from you to pay you 16:-. You double the original stake with increasingly higher accumulated probability to win. However, the chance to win is always 50% and the risk to lose is 50%. As long as you can afford to double your stakes at least 10x times on losses until you win, the odds are almost a guaranteed success and that is the American-Russian Monte Carlo game. Only God can afford to play such a game all the way to infinity, and in Scientology God is infinity to always win. The Monte Carlo simulation belief is that nobody has unlimited resources to be God for no risk and a total control. However, the biggest risk of all is that someone in Monaco has unlimited amounts of money above God to always be in control.
